Mini Project: Hotel booking

Part 2: Black-box testing

Background

The background for the project was described in part 1 of the mini project, where you developed tests for a minimal solution. The minimal solution has the following two features:

1. **Create booking**: A hotel room can be booked for a period (start date – end date) in the future provided that it is not already booked for one or more days during the desired period.

2. **View bookings**: It should be easy for the user of the web site to find out whether any rooms are available during a given period.

Requirements

There are three goals of this part of the mini project:

1. **Derive test cases**: Use relevant black-box test techniques to derive test cases for the "Create booking" feature.
2. **Cucumber testing:** Use Cucumber to implement the following tests:
    - Test the "Create booking" feature using the test cases that you have found.
    - **(optional)** Create a test which validates that fully occupied dates are calculated correctly.
3. **API testing**: Test the *Create Booking* feature using automated testing in Postman.
4. **E2E testing**: Test the *Create Booking* feature using Selenium.

You should implement all the test cases that you have found in Cucumber. For Postman and Cucumber, it is enough that you implement a couple of test cases – one where a Booking attempt succeeds and one where it fails.

Terms and conditions

I assume that you will continue with the same teams as before. If you change your team, then please update "Groups for the Mini Project" on Moodle.

Each team should demonstrate their solution to this part of the mini project during Week 45. A presentation schedule where you can select your timeslot will be published in good time before.

You should explain how you have derived test cases using black-box test techniques, how you used Cucumber to test the "Create booking" feature, how you automated API testing of the Create Booking feature, and how you used Selenium to test the Create Booking feature. Single-person teams can select to fulfil only two of these four requirements, and two-person teams can select to fulfil only three of the four

requirements. During presentations, every team member must actively participate. A single-person team has up to 10 minutes for the presentation, while other teams have up to 15 minutes.

If a team is unable to present during the scheduled week, it can contact me in good time to have the presentation re-scheduled to one week earlier or later.
